

ARTIFICIAL INTELLIGENCE

DEEP LEARNING & NEURAL NETWORKS

1 DAY WORKSHOP

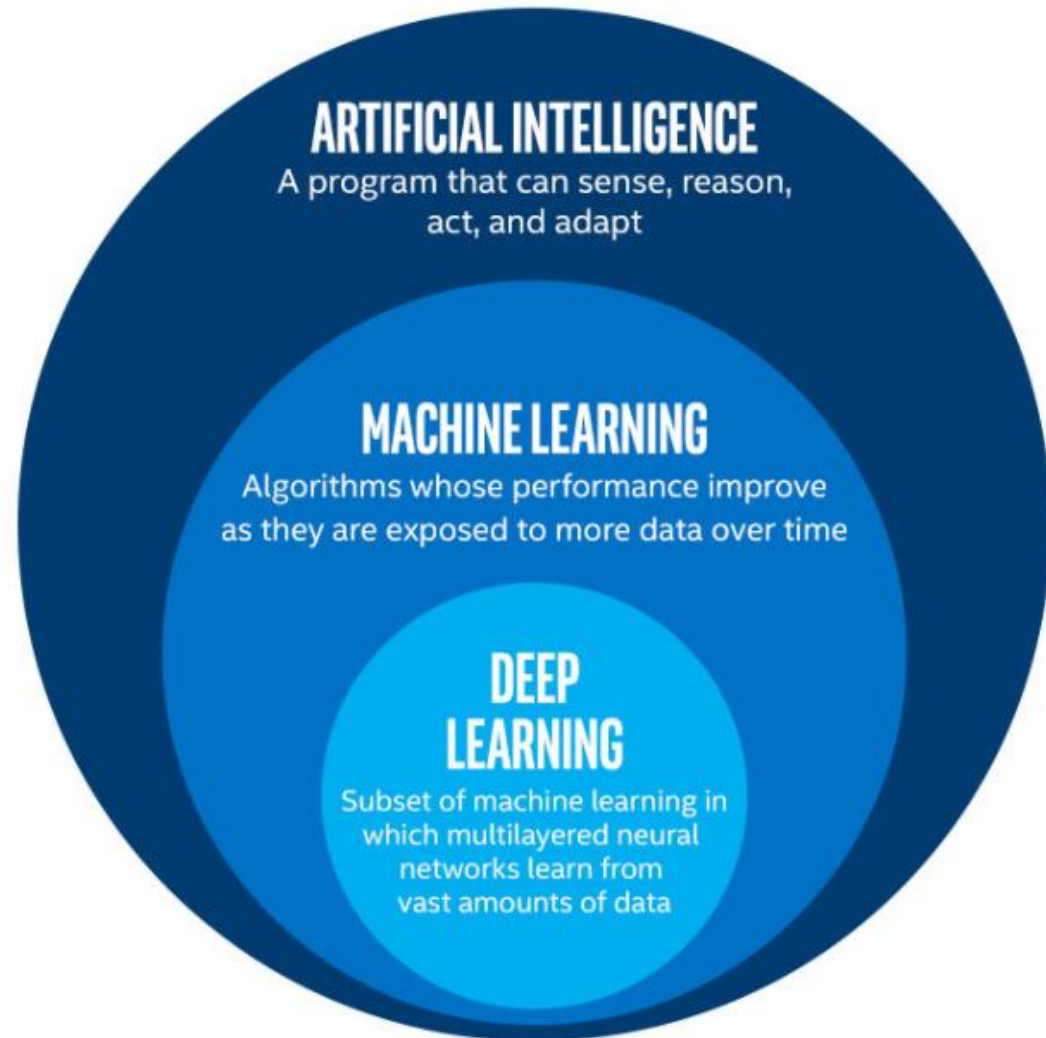

SPEAKER

Thakshila Dasun

BSc. Engineering Hons, CIMA UK, IEEE, IMech

Assistant Lecturer at SLIIT | Senior Lecturer at Academy of Innovative Education

AI vs ML vs DL

Can you Drive Cars ?

So does AI (Convolutional Neural Networks)

Can you Identify Objects ?

So does AI (Convolutional Neural Networks)

YOLO v2

<http://pureddie.com/yolo>

Can you Play Games?

So does AI (Deep Q Nets/ CNN)

Can you Read?

So does AI (Recurrent Neural Networks/LSTMs)

TalentBot

Hello! My name is TalentBot, I will be helping you for today. What's your name?

Ask a question..

POWERED BY
DiligentForceLabs

Music Composing?

So does AI (Autoencoders, GANs)

Health Care?

So does AI (Autoencoders, CNNs)

What More?

- Maps
- Stock Market Predictions
- Health Care
- Marketing/ Recommendations
- Sentiment Analysis
- Finance/ Fraud Detection
- Digital Assistants
- Ads, search, social recommendations
- Face Recognition
- Image Classification
- Speech Recognition
- Text-to-speech Generation
- Handwriting Transcription
- Machine Translation
- Medical Diagnosis
- Self Driving Cars
- Games with Deep Reinforcement Learning

DEEP LEARNING

Allow the computers learn automatically without human intervention or assistance and adjust actions accordingly

Supervised DL

learned in the past to new data using labeled examples to predict future events

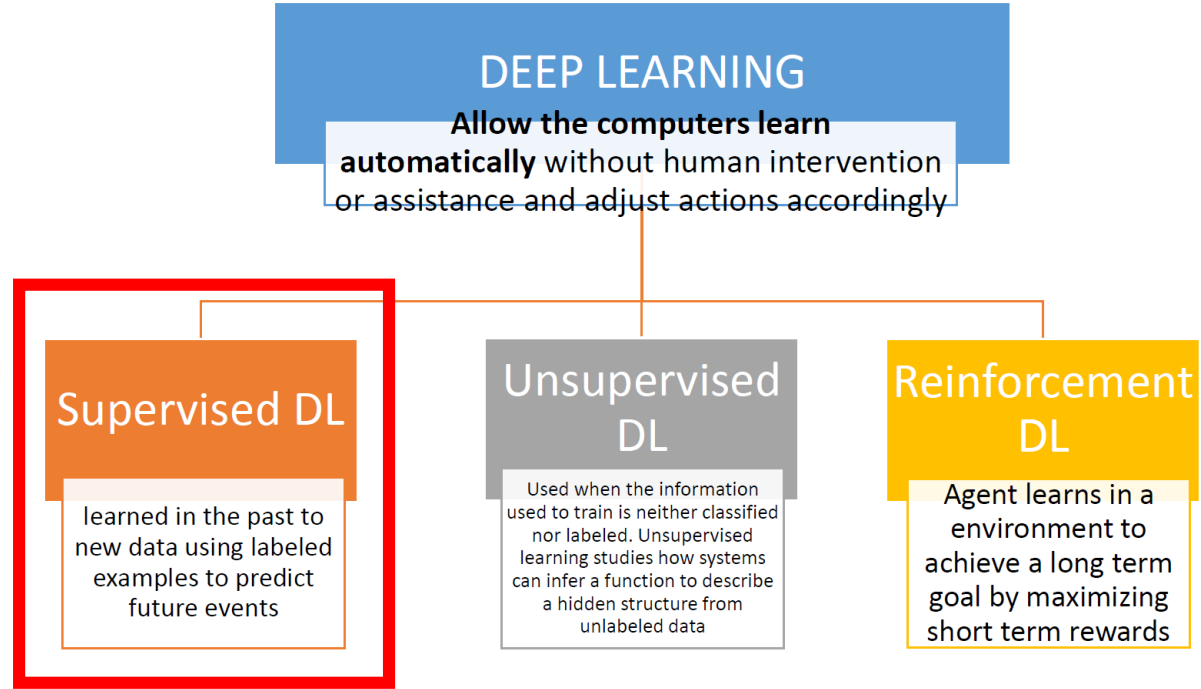

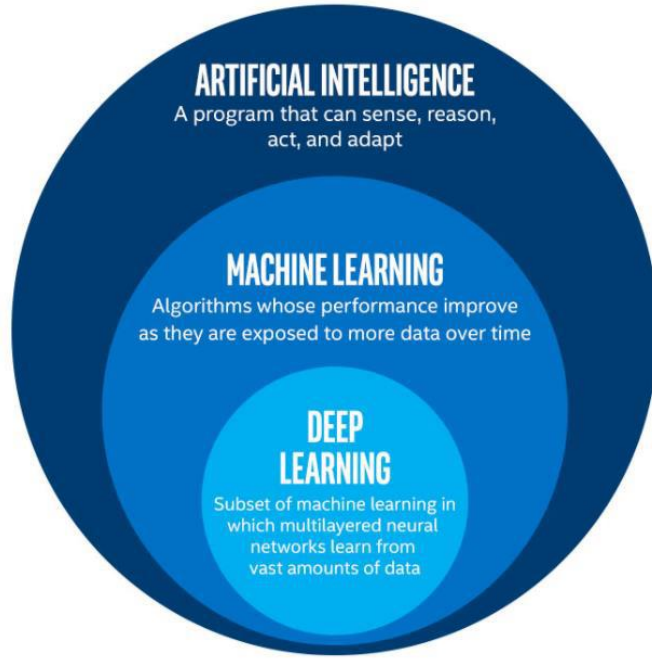

Unsupervised DL

Used when the information used to train is neither classified nor labeled. Unsupervised learning studies how systems can infer a function to describe a hidden structure from unlabeled data

Reinforcement DL

Agent learns in a environment to achieve a long term goal by maximizing short term rewards

Focus Today

Features & Labels

TRAINING

Features

TESTING

Label

RESULT

Predicting whether it is going to RAIN today or NOT

1. Identify Feature and Labels

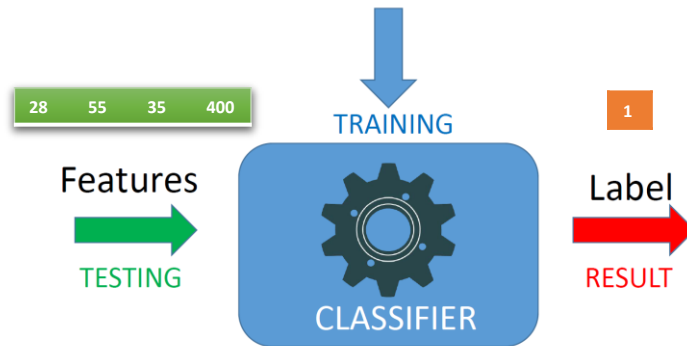

- Labels: Possible solution of the problem
- Feature: Critical Attribute that decides the labels

2. Create a dataset

Features				Labels
Temperature C	Humidity %	Wind Speed/ Kmph	Light Intensity/ lux	
28	80	20	550	0
31	50	30	420	1
33	70	40	200	1
28	60	15	160	0
32	40	20	250	0
25	60	25	560	0

28	80	20	550	0
31	50	30	420	1
33	70	40	200	1
28	60	15	160	0
32	40	20	250	0
25	60	25	560	0

Features & Labels

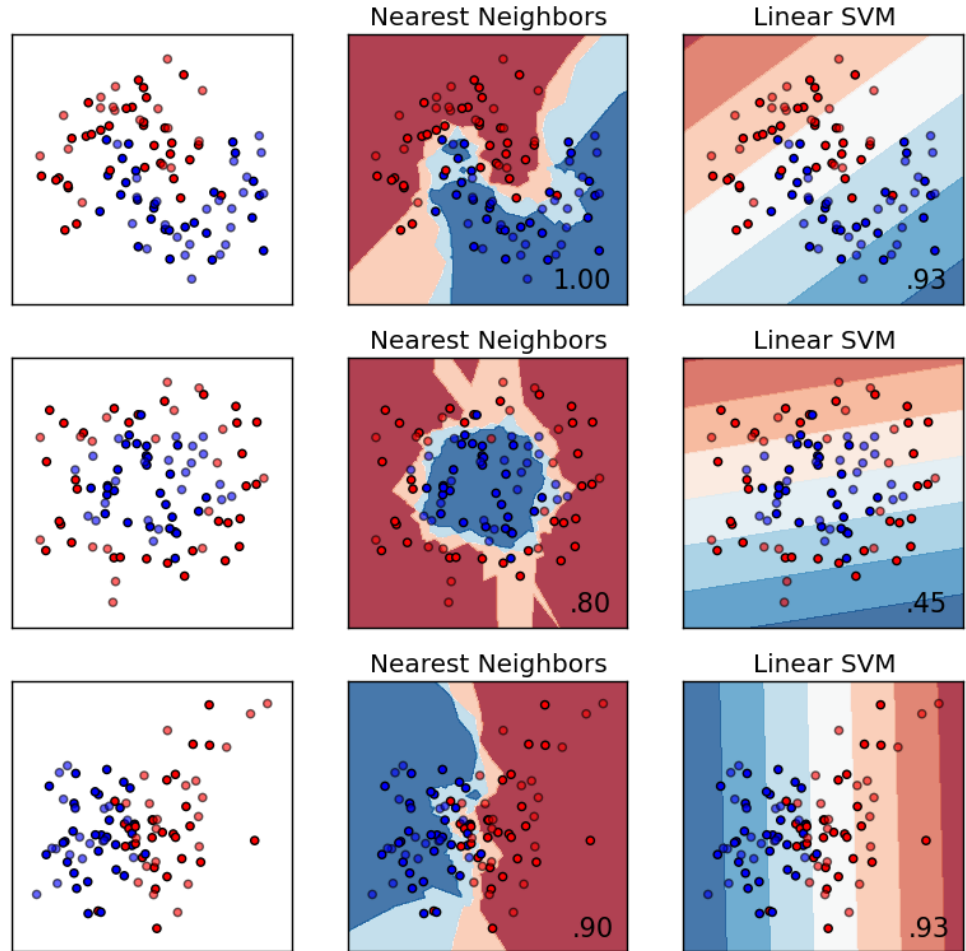

3. Train the NN

4. Test & Results

Classification & Regression

2 Types of Predictions in
Machine Learning,
Qualitative and Quantitative

1. Classification: Predicting discrete labels

- “Classification” indicates that the data has discrete class label.
- Classification predictive modeling is the task of approximating a mapping function (f) from input variables (X) to discrete output variables (y) or classes.
- The output variables are often called labels or categories. The mapping function predicts the class or category for a given observation

2. Regression: Predicting continuous labels

- Regression predictive modeling is the task of approximating a mapping function (f) from input variables (X) to a continuous output variable (y).
- A continuous output variable is a real-value, such as an integer or floating point value. These are often quantities, such as amounts and sizes.
- For example, a house may be predicted to sell for a specific dollar value, perhaps in the range of \$100,000 to \$200,000.

Why You Should Learn ML

- It is the Future Industry
- Research Opportunities for Undergraduates/ Post Graduates
- Data Scientist
- Big Data analysis
- AI Engineers
- AI based IOT and Mobile App Development
- Finance and Statistics Sector
- Stock Market Data Analysis, share value Prediction
- Automobile Industry
- Medical Industry

DEEP LEARNING

“In a neural network we don't tell the computer how to solve our problem. Instead, it learns from observational data, figuring out its own solution to the problem at hand.”

-In 2006 was the discovery of techniques for learning in so-called deep neural networks. These techniques are now known as deep learning. They've been developed further, and today deep neural networks and deep learning achieve outstanding performance on many important problems in computer vision, speech recognition, and natural language processing-

They use Deep Learning

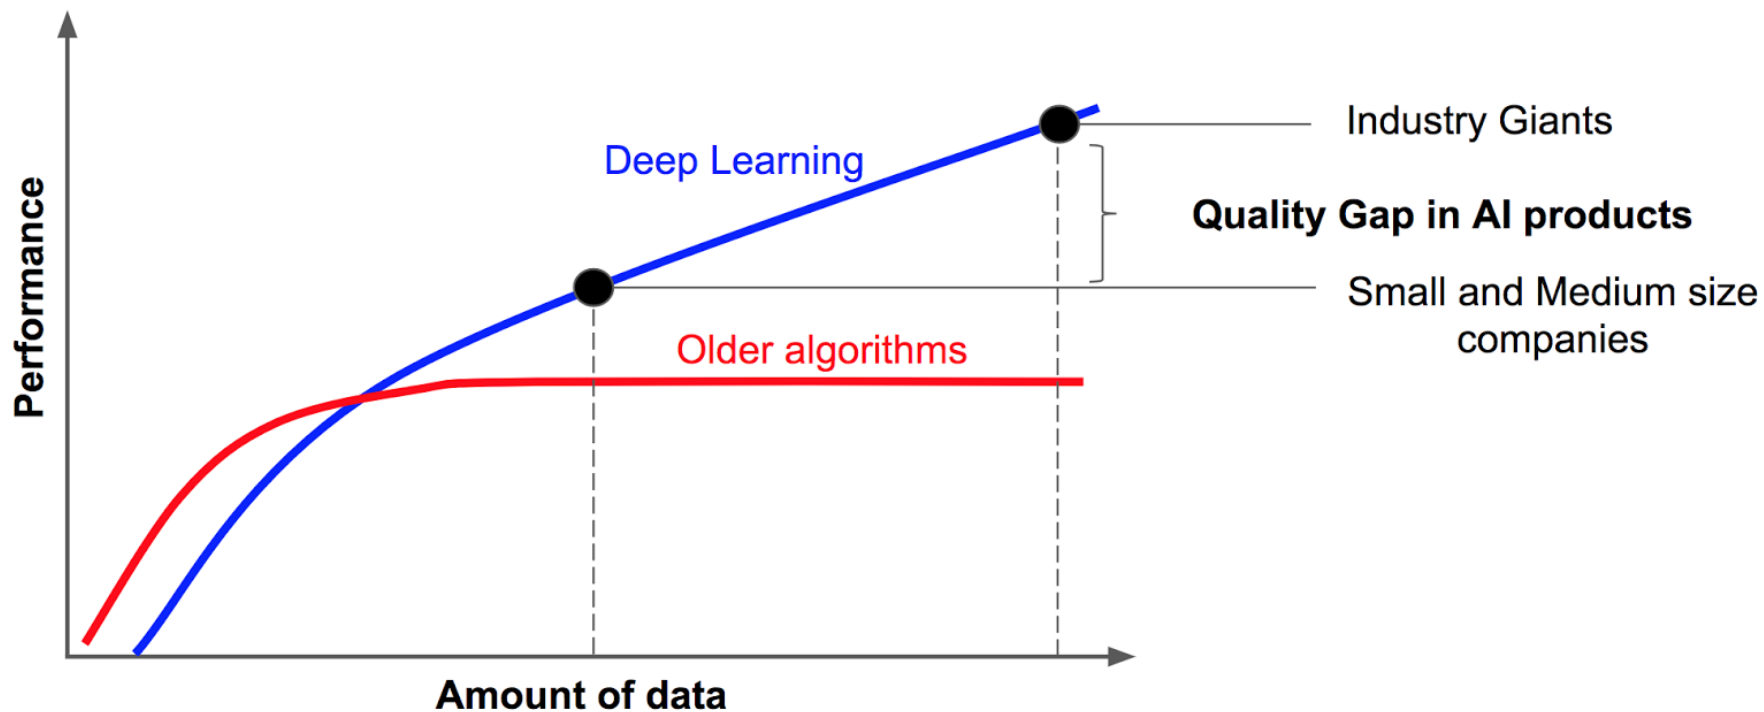

Machine Learning

Deep Learning

History In Brief (1)

- The idea of neural networks began unsurprisingly as a model of how neurons in the brain function.
 - 1943: Portrayed with a simple electrical circuit by neurophysiologist Warren McCulloch and mathematician Walter Pitt
 - 1950-1960: Perceptrons were developed by the scientist Frank Rosenblatt,

History In Brief (2)

- 1974-86: Backpropagation Algorithm, Recurrent NL
- 1989-98: Convolutional Neural Networks, Bi Directional RNN, Long Short Term Memory (LSTM), MNIST Data Set
- 2006: “Deep Learning” Concept
- 2009: ImageNet
- 2012: AlexNet, Dropout
- 2014: DeepFace
- 2016: AlphaGo
- 2017: AlphaGo Zero
- 2018: BERT

History In Brief (3)

- Mark 1 Perceptron: 1960
- Torch: 2002
- CUDA: 2007
- Theano: 2008
- Caffe: 2015
- Tensorflow 0.1: 2015
- PyTorch 0.1: 2017
- TensorFlow 1.0: 2017
- Tensorflow 2.0: 2019

Neural Network Architecture (3)

Supervised Learning

1. Feed Forward Neural Networks

2. Convolutional Neural Networks

3. Recurrent Neural Networks

4. Encoder-Decoder Architectures

Unsupervised Learning

5. Autoencoder

6. Generative Adversarial Networks

Reinforcement Learning

7. Networks for Actions, Values, Policies, and Models

Neural Network Architecture (1)

Perceptron

- Building Model of Classic Artificial Neural Networks
- Inputs, x_1, x_2, x_3
- weights, w_1, w_2, \dots , real numbers expressing the importance of the respective inputs to the output

“Perceptrons were [developed](#) in the 1950s and 1960s by the scientist [Frank Rosenblatt](#), inspired by earlier [work](#) by [Warren McCulloch](#) and [Walter Pitts](#)”

Feed Forward Neural Networks (FFNNs)

- Data passes from input to output in a single pass without any “state memory” of what came before.
- “FFNN” refers to its simplest variant: a densely-connected multilayer perceptron (MLP).
- Dense encoders are used to map an already compact set of numbers on the input to a prediction: either a classification (discrete) or a regression (continuous).

Activation Functions(1)

$$Z = \left(\sum_{i=1}^n w_i \cdot x_i \right) + b$$

$$Y = \mathbf{F}(Z)$$

Types of activation functions

- The Activation Functions can be basically divided into 2 types
 - Linear or Identity Activation Function
 - Non-linear Activation Functions

Linear or Identity Activation Function

- The activation is proportional to the input. . This can be applied to various neurons and multiple neurons can be activated at the same time
- **Equation** : $Y = F(Z) = Z$
- **Range** : (-infinity to infinity)

Non-linear Activation Functions

- The Nonlinear Activation Functions are the most used activation functions. It makes it easy for the model to generalize or adapt with variety of data and to differentiate between the output.

- 1. Sigmoid or Logistic Activation Function**
- 2. Tanh or hyperbolic tangent Activation Function:**
- 3. ReLU (Rectified Linear Unit) Activation Function**
- 4. Leaky ReLU**
- 5. Softmax**

Sigmoid or Logistic Activation Function

- **Equation** : $Y = F(Z) = \frac{1}{1 + e^{-Z}}$
- **Range** : (0 to 1)
- It gives rise to a problem of “**vanishing gradients**”, since the Y values tend to respond very less to changes in X
- It saturate and kill gradients.

Tanh or hyperbolic tangent Activation Function

- **Equation** : $Y = F(Z) = \frac{1 - e^{-2Z}}{1 + e^{-2Z}}$
- **Range** : (-1 to 1)
- It also suffers vanishing gradient problem
- It saturate and kill gradients.

ReLU (Rectified Linear Unit)

- The ReLU is the most used activation function in the world right now
- **Equation : $f(Z) = \max(0, Z)$**
- **Range : (0 to infinity)**
- The outputs are not zero centered similar to the sigmoid activation function
- When the gradient hits zero for the negative values, it does not converge towards the minima which will result in a dead neuron while back propagation

Leaky ReLU

- To solve the ReLU problem we have leaky ReLU
- **Equation** : $f(x) = ax$ for $x < 0$ and x for $x > 0$
- **Range** : (0.01 to infinity)

Softmax

- The softmax function is also a type of sigmoid function but it is very useful to handle classification problems having multiple classes.
- The softmax function is shown above, where z is a vector of the inputs to the output layer
- The softmax function is ideally used in the output layer of the classifier where we are actually trying to attain the probabilities to define the class of each input.

$$\sigma(z)_j = \frac{e^{z_j}}{\sum_{k=1}^K e^{z_k}}$$

Loss Functions

The loss of our network measures the cost incurred from incorrect predictions

$$\mathcal{L}(\underbrace{f(x^{(i)}; \mathbf{W})}_{\text{Predicted}}, \underbrace{y^{(i)}}_{\text{Actual}})$$

Mean Squared Error

Mean squared error loss can be used with regression models that output continuous real numbers

Cross Entropy

Cross entropy loss can be used with models that output a probability between 0 and 1

$$J(W) = \frac{1}{n} \sum_{i=1}^n \underbrace{y^{(i)}}_{\text{Actual}} \log \left(\underbrace{f(x^{(i)}; W)}_{\text{Predicted}} \right) + (1 - \underbrace{y^{(i)}}_{\text{Actual}}) \log \left(1 - \underbrace{f(x^{(i)}; W)}_{\text{Predicted}} \right)$$

Loss Optimization

We want to find the network weights that achieve the lowest loss

$$\mathbf{W}^* = \operatorname{argmin}_{\mathbf{W}} \frac{1}{n} \sum_{i=1}^n \mathcal{L}(f(x^{(i)}; \mathbf{W}), y^{(i)})$$

$$\mathbf{W}^* = \operatorname{argmin}_{\mathbf{W}} J(\mathbf{W})$$

Remember:

$$\mathbf{W} = \{\mathbf{W}^{(0)}, \mathbf{W}^{(1)}, \dots\}$$

Gradient

$$\text{Gradient} = \frac{\text{Change in Y}}{\text{Change in X}}$$

Gradient Descent

Compute gradient, $\frac{\partial J(W)}{\partial W}$

Update weights, $\mathbf{W} \leftarrow \mathbf{W} - \eta \frac{\partial J(W)}{\partial W}$

The Learning Rate (η)

Big Learning Rate

Just right

Too small

Adam

- Adam stands for **Adaptive Moment Estimation**. Adaptive Moment Estimation (Adam) is another method that computes adaptive learning rates for each parameter.

AdaDelta

- It is an extension of **AdaGrad** which tends to remove the *decaying learning Rate* problem of it. Instead of accumulating all previous squared gradients, **Adadelta** limits the window of accumulated past gradients to some fixed size **w**.

Adagrad

- It simply allows the learning Rate - η to **adapt** based on the parameters. So it makes big updates for infrequent parameters and small updates for frequent parameters. For this reason, it is well-suited for dealing with sparse data.

“TensorFlow is an end-to-end open source platform for machine learning. It has a comprehensive, flexible ecosystem of tools, libraries and community resources that lets researchers push the state-of-the-art in ML and developers easily build and deploy ML powered applications.”

“Keras is a high-level neural networks API, written in Python and capable of running on top of [TensorFlow](#), [CNTK](#), or [Theano](#). It was developed with a focus on enabling fast experimentation. *Being able to go from idea to result with the least possible delay is key to doing good research*”

- Allows for easy and fast prototyping (through user friendliness, modularity, and extensibility).
- Supports both convolutional networks and recurrent networks, as well as combinations of the two.
- Runs seamlessly on CPU and GPU.
